

**a higher level of
managed IT services**

Application Development Services

If you need to improve the effectiveness of your existing applications or build a powerful new web presence from the ground up, Fusepoint can design, develop and implement a customized application to suit your unique business needs. In short, we provide complete end-to-end services for high-performance web-based applications. Our comprehensive offering includes: initial assessment; design; project planning and management; development; integration with existing applications; and managed hosting. Whether you rely on us for some or all of your needs, your solution will be developed and managed with your budget and objectives in mind. After all, where would your company be without reliable, secure web applications powering your business.

Fusepoint Framework

Our team of certified experts creates scalable, robust solutions by using our unique and proven development methodology to design, build and manage your key business systems.

Built on industry best business practices, our proprietary development tools, the "Fusepoint Framework" and "Fusepoint CMS", provide the technical foundation for our application development. Using object-oriented (OO) principles, a multi-tiered architecture, and industry-recognized design patterns, the Fusepoint Framework is built on C# and .NET technology. Through ongoing enhancements of these tools we are able to create increasingly powerful, scalable and cost-effective web applications.

Open Source Code Model

Acquiring the Fusepoint Framework is part of our service and it gives you access to the fully documented source code. In contrast to a traditional proprietary and closed solution, our open source code model offers you the benefits of stability, reliability and flexibility should your business requirements change.

Architecture

Our framework was developed using a UML-based model (Unified Modeling Language) to which we added a 3-tier design that follows architecture patterns recognized throughout the industry. By using a 3-tiered layer design to separate data, business and presentation functionalities, the Fusepoint Framework can easily integrate into web-based applications and other Windows Service or standard Windows desktop applications.

Stability, Performance, Scalability

Fusepoint's proven foundation has been successfully deployed in nearly 100 transactional web applications. It is a stable and scalable development platform which can support the most rigorous and sophisticated needs.

Service Level Guarantee

When your applications are developed and hosted with Fusepoint you can rest assured that you are receiving the highest service levels in the industry for application security, performance and availability. In fact, we can guarantee the availability of your business layer applications in addition to the facility and network level infrastructure.

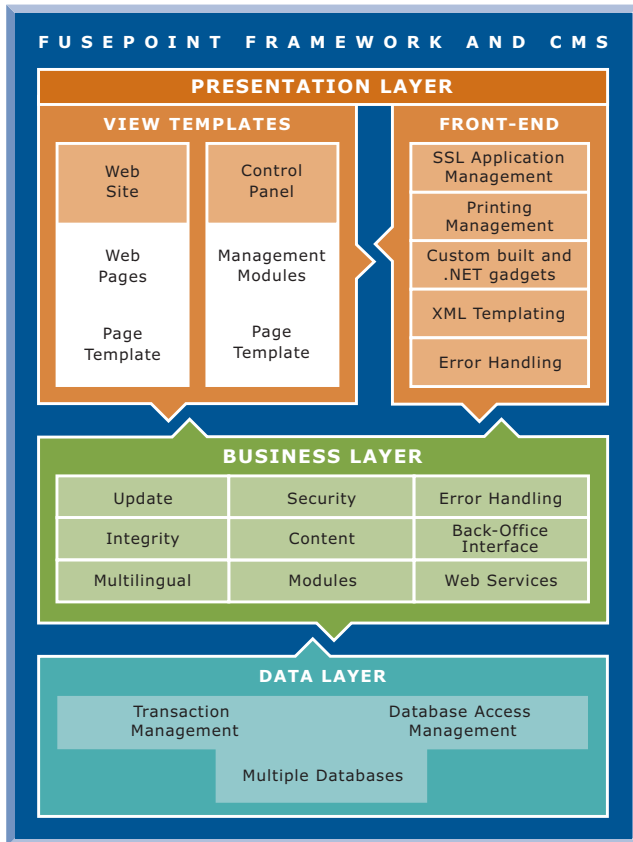

Our Customers

Some of the country's leading organizations such as Transat A.T., CAA-Québec and La Maison Simons have realized the benefits of working with a provider that can develop, deploy and manage all components of their comprehensive web solutions.

e-Solutions

Our full range of web based technology solutions includes:

- Comprehensive web content management solutions
- Robust e-commerce sites
- High-volume transactional systems
- SEO friendly web developmentSecure database development
- Web portal, Intranet and Extranet development

The Fusepoint Framework has been designed following the industry's most rigorous software architectural standards and best practices.

The 3-tier architecture provides high reusability and multi-platform / multi-application compatibility where each distinct module can be customized or replaced depending on the customer's business requirements.

A "mix and match" approach to implement individual modules that are fully tested and in full production offers a secure, cost effective way to build a flexible application that will scale to a company's future needs. These Object Oriented programming paradigms ensure easy maintenance and robust application performance.

Fusepoint CMS

The Fusepoint CMS (Content Management System) is a robust development platform with which you are able to easily and dynamically manage your web application content. The template environment and easy to use interface means less IT involvement, leading to overall cost savings for your organization.

Fusepoint Framework Feature Set

The Fusepoint Framework includes a rich feature set that is grouped into five distinct modules.

Security Module (SM)

Provides the tools and interface to manage user security and authentication as a function of their role, group membership and privileges.

Localization Module (LM)

Manages 120 languages as well as currency, headers, hyperlink alternate text, error messages and images that include textual representation in a specific language.

Informational Module (IM)

Administers all web specific informational content such as Enterprise, Mission statement, Contact Us, News and Press Releases, FAQ, Career, Confidentiality, Privacy, and external hyperlinks.

Service Module (SM)

Handles interactive functionalities such as Forums, Classified Ads, and Blogs.

Online Payment Module (OPM)

Manages all online transactional functionality such as inventory management, product search, shopping cart engine, payment method (credit, debit cards), delivery, and member profiles.
